Sub 1.126

M

13. A threaded pipe flange consisting essentially of:

a base portion having a predetermined shape and at least two openings dimensioned to accept at least two mounting bolts;

a shoulder portion extending from, and integral to, said base portion, said shoulder portion comprising at least two substantially flat gripping surfaces; and

(A.) a threaded opening extending through said base portion and said shoulder portion, said threaded opening being dimensioned for attachment to a predetermined threaded pipe;

wherein said pipe flange may be attached to said predetermined threaded pipe by aligning said threaded opening with said predetermined threaded pipe, gripping said gripping surfaces of said shoulder portion, and rotating said pipe flange.
